

7. Questions and Answers

1. How are the listings geographically distributed in Victoria? Are there certain neighborhoods with a higher concentration of listings?

The majority of listings are located in Saanich, with over 500 listings in the area. The top five neighborhoods with the highest number of listings are Saanich, Juan de Fuca, Langford, Salt Spring Island, and Downtown.

2. What is the distribution of property types and room types across Victoria's listings?

The majority of listings come from the "Entire Home" and "Entire Guest Suite" categories. The number of listings for "Entire Home" (739) and "Entire Guest Suite" (737) are nearly identical.

3. Is there a relationship between the number of bedrooms and the listing price?

There is a linear relationship between no of bedrooms and the listing price.

4. Are certain neighborhoods associated with higher listing prices compared to others?

The top five expensive neighbourhoods are Juan de Fuca, Southern Gulf Islands, Metchosin, James Bay and Salt Spring Island.

5. Is there any correlation between the number of accommodations offered and the listing price?

There is a strong correlation between no of accommodations and the listing price.

6. Which property types tend to have higher listing prices?

The Castle, Island, Entire Villa, Private Room in Resort, and Yurt are the highest-priced listings. The cost of the Castle is nearly double that of the second most expensive listing, the Island.

7. Is there a relationship between the number of reviews and the listing price?

There is little to no correlation between no of review and listing price.

8. Is there any correlation between the listing price and the average number of reviews per month?

There is little to no correlation between listing price and the average number of reviews per month.

8. Hypothesis

I have the following hypotheses that I would like to test:

1. If the number of bedrooms in a listing increases, then the price of the listing is expected to increase, with the rate of change potentially diminishing at higher bedroom counts which is likely to be influenced by property type, neighbourhood, amenities, number of beds, number of bathrooms, and/or accommodates.
2. If a listing is in the Juan de Fuca neighborhood, then its price is expected to be higher compared to listings in other neighborhoods. This difference in price may be influenced by the property type, number of bedrooms, and/or amenities. Neighbourhood desirability and proximity to key attractions could also be the possible drivers for price variation.
3. If a listing shows high availability in the next 30 days, then it is likely to exhibit high availability in the next 60 days, suggesting a temporal consistency in booking patterns.
